

Changing the line on Easyrig VARIO 5

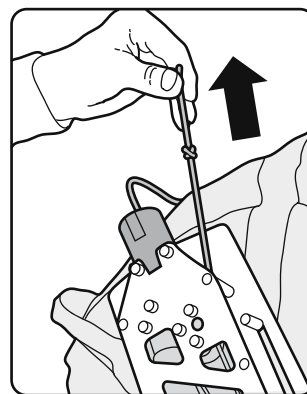

1. Put the Vario on minimum load. Extend the suspension line and hold it there by winding it around the support arm to release the power.

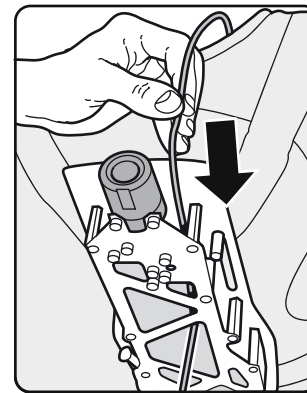

2. Detach the camera hook by untying the knot and let the line go out.

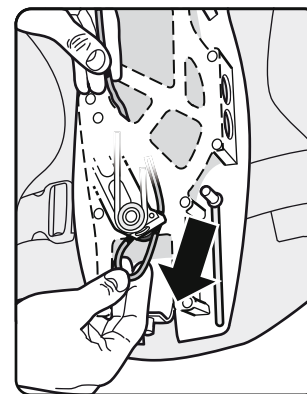

3. Remove the plastic cover by releasing the screws on the back.

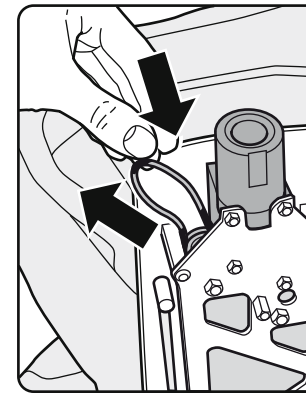

4. Remove the old line.

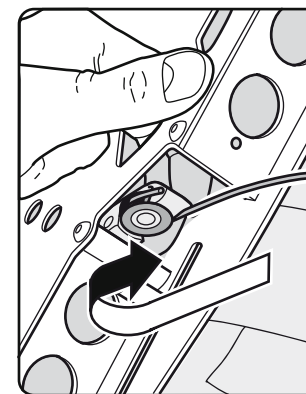

5. Start with the new line through the small plastic hole.

6. Let the line pass through the inner bottom red wheel and up.

7. The line will go around the red top wheel on the left side and then down.

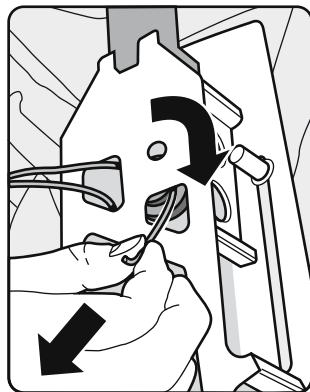

8. The line will pass the middle blue wheel at the bottom and up.

9.
The line will go around the red wheel on the right side at the top and then down.

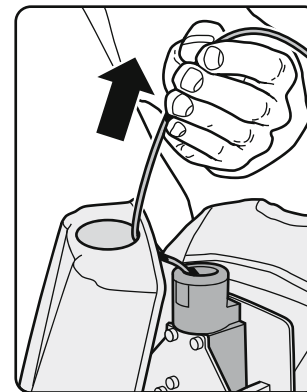

10.
The line will pass the outer bottom red wheel and then up.

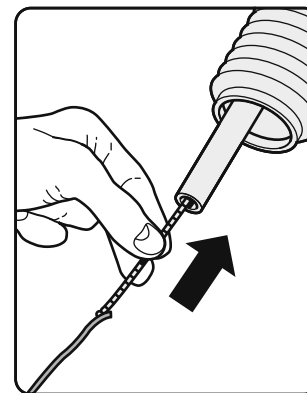

11.
Finally you will lead the line through the big black steering wheel and out where the tube is mounted.

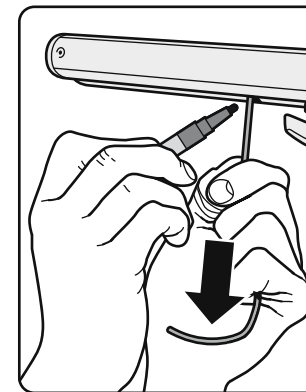

12.
Check if the Vario 5 power pack is working properly.

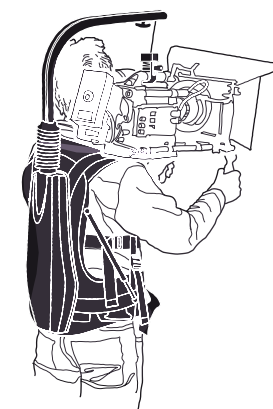

13.
Lead the line through the big hole in the cover and re-mount the plastic cover.

14.
Mount the line on the special tool to reinstall the line over the wheels in the upper support arm.

15.
When marking the line, it's important to drag it down 5cm (2inch). This is because the line has to be over stretched.

Good luck from the
